FACTSHEET

MYOB EXO API

For seamless integration with MYOB EXO Business

MYOB EXO API is designed specifically for developers to create applications using any programming language on a variety of platforms including Windows and Mac plus devices running IOS, Android and Windows Mobile OS.

TECHNICAL OVERVIEW

The EXO API runs as a Windows service connecting to the EXO Business SQL databases.

Requests are sent to, and responses received from, the AOI using JSON format. Responses include a common set of HTTP codes to indicate success or failure of a request.

Common actions supported include GET, PUT, POST and DELETE methods. The EXO API also supports use of ODATA for extensive search filtering.

Access the API locally or alternatively via the cloud using the MYOB LiveRelay which routes the requests and responses over the internet.

REST

As it built to the standard REST specification, developers wishing to consume the API - either on desktop or in the cloud - can choose any language that supports consumption of REST-based web services.

SECURITY

Your data is safe and secure with the EXO API, and integrity maintained using hash tokens. Applications using the EXO API include a developer specific identification key that ensures all transactions are from approved third parties.

MULTI-DATABASE SUPPORT

A single API instance can be used with multiple EXO Business databases simultaneously. Eash request sent to the EXO API includes credentials that identify the database connection to use.

KEY FEATURES AND BENEFITS

- Specifically designed to meet the needs of developers.
- RESTful service utilising JSON exchange format.
- Data is secure and integrity intact with the use of security tokens.
- Applies EXO Business profiles and configuration inclduing best practice, company and user specific profiles.
